
QUAIL: Accessibility Information Library Documentation

Release 2.0a1

Kevin Miller

March 10, 2015

1	Tests	3
2	Guidelines	5
2.1	Usage	5
3	Available tests	7
3.1	Adjacent links that point to the same location should be merged	7
3.2	When an image is in a link, its “alt” attribute should not repeat other text in the link	7
3.3	Link text should not begin with redundant text	8
3.4	Lists of links should be separated by printable characters	8
3.5	Links should not open a new window without warning	8
3.6	The text in links should make sense out of context	9
3.7	Any links to a multimedia file should also include a link to a transcript	9
3.8	Any links to a sound file should also include a link to a transcript	9
3.9	Links should contain text	10
3.10	All links must have a “title” attribute	10
3.11	Links should not use “javascript” in their location	11
3.12	Link text should be useful	11
3.13	The title attribute of all source a (anchor) elements describes the link destination.	11
3.14	The document should contain an address for the author	11
3.15	The document should contain a valid email address for the author	12
3.16	All applets should contain the same content within the body of the applet	12
3.17	All applets should contain a text equivalent in the “alt” attribute	12
3.18	All applets should provide a way for keyboard users to escape	13
3.19	Any user interface in an applet must be accessible	13
3.20	All applets do not flicker	13
3.21	Applets should not use color alone to communicate content	13
3.22	All “area” elements must have an “alt” attribute which describes the link destination	13
3.23	Alt text for “area” elements should replicate the text found in the image	13
3.24	No “area” elements should open a new window without warning	14
3.25	All “area” elements must have an “alt” attribute	14
3.26	All “area” elements which link to a sound file should also provide a link to a transcript	14
3.27	Pages using ARIA roles should not have orphaned content	14
3.28	Basefont” should not be used	15
3.29	The “blink” tag should not be used	15
3.30	The “blockquote” tag should not be used just for indentation	15
3.31	If long quotes are in the document, use the “blockquote” element to mark them	16
3.32	Contrast between active link text and background should be 5:1	16

3.33	Contrast between text and background should be 5:1	16
3.34	Contrast between link text and background should be 5:1	16
3.35	Body elements do not use a background image	17
3.36	Contrast between visited link text and background should be 5:1	17
3.37	The “b” (bold) element is not used	17
3.38	All checkboxes must have a corresponding label	17
3.39	All “checkbox” input elements have a label that is close	17
3.40	The document must be readable with styles turned off	18
3.41	All elements should have appropriate color contrast	18
3.42	The document should contain a valid “doctype” declaration	18
3.43	Abbreviations must be marked with an “abbr” element	18
3.44	Acronyms must be marked with an “acronym” element	19
3.45	All the document colors must be set	19
3.46	Auto-redirect with “meta” elements must not be used	19
3.47	Contrast between active link text and the background must be greater than the WAI ERT color algorithm threshold	19
3.48	Contrast between text and the background must be greater than the WAI ERT color algorithm threshold	19
3.49	Contrast between link text and the background must be greater than the WAI ERT color algorithm threshold	20
3.50	Contrast between visited link text and the background must be greater than the WAI ERT color algorithm threshold	20
3.51	Content should be readable without style sheets	20
3.52	The document should have a title element	20
3.53	All element “id” attributes must be unique	21
3.54	The document should be written to the target audience and read clearly	21
3.55	The document’s language attribute should be a standard code	21
3.56	The document must have a “lang” attribute	22
3.57	Meta” elements must not be used to refresh the content of a page	22
3.58	Reading direction of text is correctly marked	22
3.59	The page uses a strict doctype	23
3.60	The title describes the document	23
3.61	The document title should not be placeholder text	23
3.62	The document title should be short	24
3.63	The document should not have an empty title	24
3.64	Document must validate to the doctype	24
3.65	Visual lists of items are marked using ordered or unordered lists	24
3.66	Any words or phrases which are not the document’s primary language should be marked	25
3.67	All “embed” elements have an associated “noembed” element	25
3.68	Embed” elements must have an “alt” attribute	26
3.69	Embed” elements cannot have an empty “alt” attribute	26
3.70	All embed elements should provide a way for keyboard users to escape	26
3.71	Emoticons should not be used excessively	27
3.72	All “file” input elements have a corresponding label	27
3.73	All “file” input elements have a label that is close	27
3.74	Font” elements should not be used	27
3.75	Deleting items using a form should be reversable	27
3.76	Forms offer the user a way to check the results of their form before performing an irrevokable action	28
3.77	Form error messages should assist in solving errors	28
3.78	Input items which are required are marked as so in the label element	28
3.79	Frames are not used	28
3.80	Complex framesets should contain a “longdesc” attribute	28
3.81	The source for each frame is accessible content.	29
3.82	All “frame” elemetns should have a “title” attribute that describes the purpose of the frame	29
3.83	Frames cannot have empty “title” attributes	29

3.84	Frames cannot have “title” attributes that are just placeholder text	29
3.85	All “frame” elements should have a “title” attribute	30
3.86	The “frameset” element should not be used	30
3.87	All framesets should contain a noframes section	30
3.88	The header following an h1 is h1 or h2	30
3.89	All h1 elements are not used for formatting	31
3.90	The header following an h2 is h1, h2 or h3	31
3.91	All h2 elements are not used for formatting	31
3.92	The header following an h3 is h1, h2, h3 or h4	32
3.93	All h3 elements are not used for formatting	32
3.94	The header following an h4 is h1, h2, h3, h4 or h5	32
3.95	All h4 elements are not used for formatting	33
3.96	The header following an h5 is h6 or any header less than h6	33
3.97	All h5 elements are not used for formatting	33
3.98	All h6 elements are not used for formatting	34
3.99	All headers should contain readable text	34
3.100	Use headers to mark the beginning of each section	34
3.101	The “i” (italic) element is not used	34
3.102	Inline frames (“iframes”) should not have a “longdesc” attribute	35
3.103	All links in a server-side map should have duplicate links available in the document	35
3.104	If an image is purely decorative, the “alt” text must be empty	35
3.105	Any image within a link must have “alt” text the describes the link destination	35
3.106	Image “alt” attributes should not be the same as the filename	36
3.107	Check that any text within an image is also in the “alt” attribute	36
3.108	Image Alt text is short	36
3.109	An image within a link cannot have an empty “alt” attribute if there is no other text within the link	36
3.110	Images should not have a simple placeholder text as an “alt” attribute	37
3.111	Unless the image files are the same, no image should contain redundant alt text	37
3.112	Any animated GIF should not flicker	38
3.113	Image elements must have an “alt” attribute	38
3.114	A “longdesc” attribute is required for any image where additional information not in the “alt” attribute is required	38
3.115	Images that are important should not have a purely white-space “alt” attribute	39
3.116	All links within a client-side image are duplicated elsewhere in the document	39
3.117	An image with a “longdesc” attribute should have a corresponding description link	39
3.118	Any non-decorative images should have a non-empty “alt” attribute	39
3.119	For any image, the “alt” text cannot refer to color alone	40
3.120	Server-side image maps should not be used	40
3.121	Images should not have a “title” attribute	40
3.122	Any image with an “ismap” attribute have a valid “usemap” attribute	40
3.123	Images which contain math equations should provide equivalent MathML	41
3.124	All “checkbox” input elements require a valid “tabindex” attribute	41
3.125	Logical groups of check boxes should be grouped with a “fieldset	41
3.126	An “input” element should not use color alone	42
3.127	Input elements which are not images should not have an “alt” attribute	42
3.128	All “file” input elements require a valid “tabindex” attribute	42
3.129	All “input” elements with a type of “image” must have an “alt” attribute that describes the function of the input	42
3.130	All “input” elements with a type of “image” must have an “alt” attribute which is not the same as the filename	42
3.131	All “input” elements with a type of “image” must have an “alt” attribute which is not placeholder text	42
3.132	All “input” elements with a type of “image” must have an “alt” attribute which is as short as possible	43
3.133	The “alt” text for input “image” submit buttons must not be filler text	43
3.134	All “input” elements with a type of “image” must have an “alt” attribute	43

3.135	The “alt” text for input “image” buttons must be the same as text inside the image	44
3.136	All “password” input elements require a valid “tabindex” attribute	44
3.137	All “radio” input elements require a valid “tabindex” attribute	44
3.138	All input elements, type of “submit	44
3.139	All “input” elements should have a corresponding “label	44
3.140	All “text” input elements require a valid “tabindex” attribute	44
3.141	All “input” elements of type “text” must have a default text	45
3.142	Text” input elements require a non-whitespace default text	45
3.143	Label” elements should not contain an input element	45
3.144	Every form input must have only one label	46
3.145	Labels must contain text	46
3.146	All labels should be associated with an input	46
3.147	All “legend” elements must describe the group of choices	47
3.148	Legend” text must not contain just whitespace	47
3.149	Legend” text must not contain placeholder text like “form” or “field	47
3.150	Use a “link” element for alternate content	48
3.151	Document uses link element to describe navigation if it is within a collection.	48
3.152	Lists should not be used for formatting	48
3.153	The “marquee” tag should not be used	49
3.154	Menu” elements should not be used for formattin	49
3.155	Noembed” elements must be the same content as their “embed” element	49
3.156	All “noframes” elements should contain the text content from all frames	50
3.157	When objects are disabled, content should still be available	50
3.158	Objects do not flicker	50
3.159	Objects must not use color to communicate alone	51
3.160	Interfaces within objects must be accessible	51
3.161	Objects which reference multimedia files should also provide a link to a transcript	51
3.162	Objects must contain their text equivalents	51
3.163	Every object should contain an “embed” element	52
3.164	Objects should have a title attribute	52
3.165	Objects must not have an empty title attribute	52
3.166	All objects should provide a way for keyboard users to escape	53
3.167	An object might require a long description	53
3.168	The text equivalents of an object should update if the object changes	53
3.169	Content within an “object” element should be usable with objects disabled	54
3.170	Objects with “classid” attributes should change their text if the content of the object changes	54
3.171	Paragraphs must not be used for headers	54
3.172	All password input elements should have a corresponding label	54
3.173	All “password” input elements have a label that is close	55
3.174	Pre” elements should not be used for tabular data	55
3.175	All “radio” input elements have a corresponding label	55
3.176	All “radio” input elements have a label that is close	55
3.177	All radio button groups are marked using fieldset and legend elements.	55
3.178	Content on the page should still be available if scripts are disabled	55
3.179	Scripts should have a corresponding “noscript” element	56
3.180	If an element has an “onclick” attribute	56
3.181	Any element with an “ondblclick” attribute shoul have a keyboard-related action as well	56
3.182	If an element has a “mousedown” attribute	56
3.183	Any element with an “onmousemove” attribute shoul have a keyboard-related action as well	56
3.184	If an element has a “onmouseout” attribute	57
3.185	If an element has an “onmouseover” attribute	57
3.186	If an element has an “onmouseup” attribute	57
3.187	The user interface for scripts should be accessible	57
3.188	Scripts should not cause the screen to flicker	57

3.189	The interface in scripts should not use color alone	57
3.190	Select elements must not contain an "onchange" attribute	57
3.191	All select elements have an explicitly associated label.	58
3.192	Select jump menus should jump on button press, not on state change	58
3.193	Form select elements should use optgroups for long selections	58
3.194	Websites must have a site map	58
3.195	A "skip to content" link should exist as one of the first links on the page	58
3.196	Inline SVG should use Title elements	59
3.197	The tab order of a document is logical	59
3.198	Captions should identify their table	59
3.199	Complex tables should have a summary	59
3.200	Data tables should contain "th" elements	59
3.201	Table header labels must be terse	59
3.202	Mark up the areas of tables using "thead"	60
3.203	Layout tables should not contain "th" elements	60
3.204	All tables used for layout have no "caption" element	60
3.205	All tables used for layout have no summary or an empty summary	60
3.206	All tables used for layout should make sense when removed	61
3.207	Table summaries should describe the navigation and structure of the table	61
3.208	Table "summary" elements should not duplicate the "caption" element	61
3.209	All data tables should have a summary	61
3.210	All data tables should have an adequate summary	61
3.211	Group columns using "colgroup" or "col" elements	62
3.212	Table headers over 20 characters should provide an "abbr" attribute	62
3.213	Data tables should contain a "caption" element if not described elsewhere	62
3.214	Data tables should use scoped headers for rows with headers	63
3.215	Data tables with multiple headers should use the "scope" attribute	64
3.216	Complex data tables should provide "id" attributes to headers	64
3.217	All tabular information should use a table	64
3.218	The text size is not less than 9 pixels high	64
3.219	All textareas should have a corresponding label	64
3.220	All textareas should have a label that is close to it	64
3.221	All video tags must provide captions	65
3.222	All linked or embedded videos need captions	65

4 Indices and tables **67**

QUAIL is a jQuery and Sizzle-compatible library for checking content against accessibility guidelines. It provides a flexible way to test for certain problems (say, images missing an alt text) and a collection of over **250** tests to get you started.

Tests

At the core of QUAIL are **tests**. Tests search for a single type of accessibility problem, and they are all defined in the file `src/resources/tests.yaml` (a JSON version is available in `dist/tests.json` - read more about building these files). For example, one of the most common accessibility problems out there is an image missing an `alt` attribute (which allows users with screen readers to hear a description of the image). The test definition in the `tests.yaml` file looks like this:

```
imgHasAlt:
  selector: "img:not(img[alt])"
  tags:
    - "image"
    - "content"
  testability: 1
  type: "selector"
  guidelines:
    508:
      - "a"
    wcag:
      1.1.1:
        techniques:
          - "F65"
          - "H37"
  title:
    en: "Image elements must have an \"alt\" attribute"
  description:
    en: "All <code>img</code> elements must have an alt attribute"
  ....
```

The test name in this example is “imgHasAlt,” which is the unique label for the test. These are used in creating guidelines. The

- **type** - QUAIL has some default test types to simplify the process of writing test definitions. The simplest is a *selector*, which just takes a jQuery/Sizzle-compatible selector and finds all items that match that selector. For *selector* tests, we also must define the selector to use (in this case, `img:not(img[alt])`).
- **severity** - The default severity level. Severity is a measure of how certain we are a test will not create false positives: - **severe** - We are 100% certain that this test is always correct. If an image is missing its `alt` attribute, it’s missing its `alt` attribute. - **moderate** - We are mostly certain this test is correct. This is usually found for content-related tests, like testing to see if a block of text is written at or below a certain grade level. - **suggestion** - We cannot test for this, but can suggest things to manually review. For example, we cannot test that content in a Flash object is accessible, but we can point out that a flash object is there and link to appropriate guidelines on making accessible flash.
- **guidelines** - A list of pre-defined guidelines (right now, either 508 or WCAG 2.0) including: - **techniques** - The WCAG techniques aligned with this test - **configuration** - Optional configuration options for this

test only specific to this test.

- **title** - The human-readable title of the test, prefixed by language code.
- **description** - The human-readable description of the test, prefixed by language code.

Guidelines

Guidelines are simply a collection of tests. QUAIL comes with US Section 508 and WCAG guideline files in *src/resources/guidelines*. Every guideline is simply an array of test names, which means you can easily create your own guidelines. In the *examples/php* directory you can see a custom guideline being defined in a PHP script.

2.1 Usage

To use QUAIL, you will need to make a simple jQuery/Sizzle object (in this example, we are checking an element with the ID of *content*), then run the *quail* function against it:

```
$('#content').quail({ jsonPath : 'src/resources',
  guideline : 'wcag2a',
  accessibilityTests : accessibilityTests,
  testFailed : function(event) { ... },
  customTests : {
    myCustomTest : {
      type : 'custom',
      callback : function(quail) {
        quail.html.find('.error').each(function() {
          quail.testFails('myCustomTest', $(this));
        })
      }
    }
  },
  complete : function(event) { ... },
});
```

The *quail* function accepts a single object with the following items:

- **jsonPath** - *Required* - The path to the *resources* folder where QUAIL is located. Certain tests load additional strings like emoticons or filler words from JSON files to save space. If a test ends up needing to load additional resources, this will be required.
- **guideline** - *Required* - Either the name of a guideline file that can be found in the *jsonPath* directive, or an array of test names.
- **accessibilityTests** - *Optional* - If you wish to load your own custom test definitions, this will prevent QUAIL from using its own *tests.json* file to load the tests. This is also useful if you are loading *tests.json* through your own method and don't want QUAIL to do it for you.
- **testFailed** - *Optional* - A callback that will be called everytime an item fails a test. This callback receives an object with the following items:

- **element** - The native jQuery/Sizzle object that represents the DOM element.
- **testName** - The name of the test that failed
- **severity** - The severity of the test.
- **options** - Additional options as passed by the test definition.
- **customTests** - *Optional* - An object of tests that can be added to QUAIL on the fly. Tests should have a name, and either use some of the pre-defined callbacks in QUAIL (like “selector”), or a “custom” type, where you define a callback that accepts a QUAIL object.
- **preFilter** - *Optional* - A callback that can be used to pre-filter out failed items. If this callback returns false, then the item is skipped and not considered failed. This callback receives the following arguments: - **testName** - The name of the test that failed - **element** - A full jQuery/Sizzle object of the element - **options** - Any additional options set by the test
- **complete** - *Optional* - Called when all the tests are completed. This is useful for reporting, as it gets a summary of all results. This callback gets a single object with the following items:
 - **totals** - An object with the total number of severe, moderate, and suggestion tests which failed.
 - **results** - An object with all the elements and tests that failed.

Available tests

3.1 Adjacent links that point to the same location should be merged

Severity code: Severe error

Because many users of screen-readers use links to navigate the page, providing two links right next to each other that points to the same location can be confusing. Try combining the links.

3.1.1 Example

Wrong

```
You can also <a href="article.html">read more of</a> <a href="article.html">my great article</a>.
```

Right

```
You can also <a href="article.html">read more of my great article</a>.
```

3.1.2 Example

3.2 When an image is in a link, its “alt” attribute should not repeat other text in the link

Severity code: Severe error

Images within a link should not have an alt attribute that simply repeats the text found in the link. This will cause screen readers to simply repeat the text twice.

3.2.1 Example

Wrong

```
<a href="home.html">Return home</a>
```

Right

```
<a href="home.html">Return home</a>
```

3.3 Link text should not begin with redundant text

Severity code: 0

Link text should not begin with redundant words or phrases like “link

3.4 Lists of links should be seperated by printable characters

Severity code: Severe error

If a list of links is provided within the same element, those links should be seperated by a non-linked, printable character. Structures like lists are not included in this.

3.4.1 Example

3.4.2 Wrong

```
<a href="a.html">Page A</a> <a href="b.html">Page B</a> <a href="c.html">Page C</a>
```

3.4.3 Right

```
<a href="a.html">Page A</a> | <a href="b.html">Page B</a> | <a href="c.html">Page C</a>
```

3.5 Links should not open a new window without warning

Severity code: Severe error

Links which open a new window using the “target” attribute should warn users.

3.5.1 Example

3.5.2 Wrong

```
<a href="page.html">View my page</a>
```

3.5.3 Right

`View my page (opens new window)`

3.6 The text in links should make sense out of context

Severity code: 0

All links should make sense out of context. Many non-sighted users skip from link-to-link to navigate a page, and links which do not make sense on their own can make the page difficult to navigate.

3.6.1 Example

3.6.2 Wrong

To know more about me, visit my `page`.

3.6.3 Right

To know more about me

3.7 Any links to a multimedia file should also include a link to a transcript

Severity code: Information only

Links to a multimedia file should be followed by a link to a transcript of the file.

3.7.1 Example

3.7.2 Wrong

`Watch the interview`

3.7.3 Right

`Watch the interview (transcript)`

3.8 Any links to a sound file should also include a link to a transcript

Severity code: Information only

Links to a sound file should be followed by a link to a transcript of the file.

3.8.1 Example

3.8.2 Wrong

```
<a href="interview.mp3">Listen to the interview</a>
```

3.8.3 Right

```
<a href="interview.mp3">Listen to the interview</a> <a href="transcript.html">(transcript)</a>
```

3.9 Links should contain text

Severity code: Severe error

Because many users of screen-readers use links to navigate the page, providing links with no text (or with images that have empty “alt” attributes and no other readable text) hinders these users.

3.9.1 Example

Wrong

```
<a href="home.png"></a>
```

```
<a href="home.png"></a>
```

Right

```
<a href="home.png">Return Home</a>
```

```
<a href="home.png"></a>
```

3.10 All links must have a “title” attribute

Severity code: Severe error

Every link must have a “title” attribute.

3.10.1 Example

3.10.2 Wrong

```
<a href="home.html">Home</a>
```

3.10.3 Right

```
<a href="home.html" title="Return to home">Home</a>
```

3.11 Links should not use “javascript” in their location

Severity code: Severe error

Anchor (<code>a) elements may not use the “javascript” protocol in their “href” attributes.

3.12 Link text should be useful

Severity code: 0

Because many users of screen-readers use links to navigate the page, providing links with text that simply read “click here” gives no hint of the function of the link

3.13 The title attribute of all source a (anchor) elements describes the link destination.

Severity code: Information only

Every link must have a “title” attribute which describes the purpose or destination of the link.

3.13.1 Example

3.13.2 Wrong

```
<a href="home.html" title="A web page">Home</a>
```

3.13.3 Right

```
<a href="home.html" title="Return to home">Home</a>
```

3.14 The document should contain an address for the author

Severity code: Severe error

Documents should provide a valid email address within an <code>address element.

3.15 The document should contain a valid email address for the author

Severity code: Possible error

Documents should provide a valid email address within an `<code>address` element.

3.16 All applets should contain the same content within the body of the applet

Severity code: Severe error

Applets should contain their text equivalents or description within the `<code>applet` tag itself.

3.16.1 Example

3.16.2 Wrong

```
<applet archive="whyareyouusingapplet.jar"></applet>
```

3.16.3 Right

```
<applet archive="whyareyouusingapplet.jar">Why are you still using applets?</applet>
```

3.17 All applets should contain a text equivalent in the “alt” attribute

Severity code: Possible error

Applets should contain their text equivalents or description in an “alt” attribute.

3.17.1 Example

3.17.2 Wrong

```
<applet archive="whyareyouusingapplet.jar"></applet>
```

3.17.3 Right

```
<applet archive="whyareyouusingapplet.jar" alt="Why are you still using applets?"></applet>
```

3.18 All applets should provide a way for keyboard users to escape

Severity code: Information only

Ensure that a user who has only a keyboard as an input device can escape an `<code>applet` element. This requires manual confirmation.

3.19 Any user interface in an applet must be accessible

Severity code: Information only

Applet content should be assessed for accessibility.

Applets cannot be checked using automated tools, this should be reviewed manually.

3.20 All applets do not flicker

Severity code: Information only

Applets should not flicker.

Applets cannot be checked using automated tools, this should be reviewed manually.

3.21 Applets should not use color alone to communicate content

Severity code: Information only

Applets should contain content that makes sense without color and is accessible to users who are color blind.

Applets cannot be checked using automated tools, this should be reviewed manually.

3.22 All “area” elements must have an “alt” attribute which describes the link destination

Severity code: 0

All `<code>area` elements within a `<code>map` must have an “alt” attribute

3.23 Alt text for “area” elements should replicate the text found in the image

Severity code: Information only

If an image is being used as a map, and an `<code>area` encompasses text within the image, then the “alt” attribute of that `<code>area` element should be the same as the text found in the image.

3.24 No “area” elements should open a new window without warning

Severity code: 0

No `<area>` elements should open a new window without warning.

3.24.1 Example

3.24.2 Wrong

```
<map name="worldmap"> <area shape="rect" coords="0
```

3.25 All “area” elements must have an “alt” attribute

Severity code: 0

All `<area>` elements within a `<map>` must have an “alt” attribute.

3.25.1 Example

3.25.2 Wrong

```
<map name="worldmap"> <area shape="rect" coords="0
```

3.26 All “area” elements which link to a sound file should also provide a link to a transcript

Severity code: 0

All `<area>` elements which link to a sound file should have a text transcript

3.26.1 Example

3.26.2 Wrong

```
<map name="people"> <area shape="rect" coords="0
```

3.27 Pages using ARIA roles should not have orphaned content

Severity code: Severe error

If a page makes use of ARIA roles, then there should not be any content on the page which is not within an element that exposes a role, as it could cause that content to be rendered inaccessible to users with screen readers.

3.28 Basefont” should not be used

Severity code: Severe error

The `<basefont>` tag is deprecated and should not be used. Investigate using stylesheets instead.

3.29 The “blink” tag should not be used

Severity code: Severe error

The `<blink>` tag should not be used. Ever.

3.29.1 Example

3.29.2 Wrong

```
<blink>Please read me!</blink>
```

3.29.3 Right

```
<strong>Please read me!</strong>
```

3.30 The “blockquote” tag should not be used just for indentation

Severity code: Possible error

Blockquote tags are for actual long passages of quoted material, not just for formatting. Instead of

Automated tests cannot tell if this is an actual quote or not, so the content of any `<blockquote>` should be reviewed manually to see if it is an actual quote or not.

3.30.1 Example

3.30.2 Wrong

```
<blockquote>Something I just wanted indented.</blockquote>
```

3.30.3 Right

```
<p style="margin-left: 20px;">Something I just wanted indented.</p>
```

3.31 If long quotes are in the document, use the “blockquote” element to mark them

Severity code: Possible error

Blockquote tags are for actual long passages of quoted material, and should be used in these cases.

Automated tests cannot tell if text is an actual quote or not, so the content of any `<code>blockquote` should be reviewed manually.

3.31.1 Example

3.31.2 Wrong

`<p>`A long quote of several sentences. This should probably be placed in a blockquote, as it is too long.`</p>`

3.31.3 Right

`<p>``<blockquote>`A long quote of several sentences. This should probably be placed in a blockquote, as it is too long.`</blockquote>``</p>`

3.32 Contrast between active link text and background should be 5:1

Severity code:

The contrast ratio of active link text should be at least 5:1 between the foreground text and the background. ``Learn more about color contrast and how to measure it.``

3.33 Contrast between text and background should be 5:1

Severity code:

The contrast ratio of text should be at least 5:1 between the foreground text and the background. ``Learn more about color contrast and how to measure it.``

3.34 Contrast between link text and background should be 5:1

Severity code:

The contrast ratio of link text should be at least 5:1 between the foreground text and the background. ``Learn more about color contrast and how to measure it.``

3.35 Body elements do not use a background image

Severity code: Severe error

The `<body>` element for the page may not have a “background” attribute.

3.36 Contrast between visited link text and background should be 5:1

Severity code:

The contrast ratio of visited link text should be at least 5:1 between the foreground text and the background. `Learn more about color contrast and how to measure it.`

3.37 The “b” (bold) element is not used

Severity code: Severe error

The `` (bold) element provides no emphasis for non-sighted readers. Use the `` tag instead.

3.37.1 Example

3.37.2 Wrong

```
<p>I think that you <b>should really read this</b>.</p>
```

3.37.3 Right

```
<p>I think that you <strong>should really read this</strong>.</p>
```

3.38 All checkboxes must have a corresponding label

Severity code: 0

All `<input>` elements with a type of “checkbox” should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.39 All “checkbox” input elements have a label that is close

Severity code: Possible error

All input elements of type “checkbox” must have a corresponding label that is close to the form element. Users of screen magnification or with reduced spatial skills are hampered in using a form element if the label for that element is located far away.

3.40 The document must be readable with styles turned off

Severity code: Information only

With all the styles for a page turned off, the content of the page should still make sense. Try to turn styles off in the browser and see if the page content is readable and clear.

3.41 All elements should have appropriate color contrast

Severity code: Severe error

For users who have color blindness, all text or other elements should have a color contrast of 5:1.

3.42 The document should contain a valid “doctype” declaration

Severity code: Severe error

Each document must contain a valid doctype declaration..

3.42.1 Example

3.42.2 Wrong

```
<html>
```

3.42.3 Right

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Strict//EN" "http://www.w3.org/TR/xhtml1/DTD/xhtml1-str
```

3.43 Abbreviations must be marked with an “abbr” element

Severity code: Possible error

Abbreviations should be marked with an `<abbr>` element, at least once on the page for each abbreviation.

3.43.1 Example

3.43.2 Wrong

```
<p>I work for the CIA.</p>
```

3.43.3 Right

```
<p>I work for the <abbr title="Central Intelligence Agency">CIA</abbr>.</p>
```

3.44 Acronyms must be marked with an “acronym” element

Severity code: Possible error

Abbreviations should be marked with an `<acronym>` element, at least once on the page for each abbreviation.

3.44.1 Example

3.44.2 Wrong

```
<p>I work for the CIA.</p>
```

3.44.3 Right

```
<p>I work for the <acronym title="Central Intelligence Agency">CIA</acronym>.</p>
```

3.45 All the document colors must be set

Severity code: Severe error

If any colors for text or the background are set in the `<body>` element, then all colors must be set.

3.46 Auto-redirect with “meta” elements must not be used

Severity code: 0

Because different users have different speeds and abilities when it comes to parsing the content of a page, a “meta-refresh” method to redirect users can prevent users from fully understanding the document before being redirected. If a pure redirect is needed

3.47 Contrast between active link text and the background must be greater than the WAI ERT color algorithm threshold

Severity code:

The contrast between foreground active link text and the background must be more than the WAI ERT threshold.
Learn more about WAI ERT color contrast and how to measure it.

3.48 Contrast between text and the background must be greater than the WAI ERT color algorithm threshold

Severity code:

The contrast between foreground text and the background must be more than the WAI ERT threshold. [Learn more about WAI ERT color contrast and how to measure it.](http://www.w3.org/WAI/ER/IG/ert/#color-contrast)

3.49 Contrast between link text and the background must be greater than the WAI ERT color algorithm threshold

Severity code:

The contrast between foreground link text and the background must be more than the WAI ERT threshold. [Learn more about WAI ERT color contrast and how to measure it.](http://www.w3.org/WAI/ER/IG/ert/#color-contrast)

3.50 Contrast between visited link text and the background must be greater than the WAI ERT color algorithm threshold

Severity code:

The contrast between foreground visited link text and the background must be more than the WAI ERT threshold. [Learn more about WAI ERT color contrast and how to measure it.](http://www.w3.org/WAI/ER/IG/ert/#color-contrast)

3.51 Content should be readable without style sheets

Severity code: Information only

With all the styles for a page turned off, the content of the page should still make sense. Try to turn styles off in the browser and see if the page content is readable and clear.

3.52 The document should have a title element

Severity code: Severe error

The document should have a title element.

3.52.1 Example

3.52.2 Wrong

```
<html lang="en"><head></head><body>....
```

3.52.3 Right

```
<html lang="en"><head><title>My Great Web page</title></head><body>....
```

3.53 All element “id” attributes must be unique

Severity code: Severe error

Element “id” attributes must be unique.

3.53.1 Example

3.53.2 Wrong

```
<p id="paragraph">First Paragraph</p><p id="paragraph">Second Paragraph</p>
```

3.53.3 Right

```
<p id="paragraph-1">First Paragraph</p><p id="paragraph-2">Second Paragraph</p>
```

3.54 The document should be written to the target audience and read clearly

Severity code: Possible error

If a document is beyond a 10th grade level, then a summary or other guide should also be provided to guide the user through the content.

3.55 The document’s language attribute should be a standard code

Severity code: Severe error

The document should have a default language, and that language should use the valid 2 or 3 letter language code according to ISO specification 639.

3.55.1 Example

3.55.2 Wrong

```
<html lang="English">
```

3.55.3 Right

```
<html lang="en">
```

3.56 The document must have a “lang” attribute

Severity code: Severe error

The document should have a default language, by setting the “lang” attribute in the `<html>` element.

3.56.1 Example

3.56.2 Wrong

```
<html>
```

3.56.3 Right

```
<html lang="en">
```

3.57 Meta” elements must not be used to refresh the content of a page

Severity code: Severe error

Because different users have different speeds and abilities when it comes to parsing the content of a page, a “meta-refresh” method to reload the content of the page can prevent users from having full access to the content. Try to use a “refresh this” link instead..

3.57.1 Example

3.57.2 Wrong

```
<head><meta http-equiv="refresh" content="60"></head>
```

3.57.3 Right

```
<head></head><body><a href="here.html">Refresh</a></body>
```

3.58 Reading direction of text is correctly marked

Severity code: Possible error

Where required, the reading direction of the document (for language that read in different directions), or portions of the text, must be declared.

3.59 The page uses a strict doctype

Severity code: Severe error

The doctype of the page or document should be either an HTML or XHTML strict doctype.

3.60 The title describes the document

Severity code: Information only

The document title should actually describe the page. Often, screen readers use the title to navigate from one window to another.

This test is a suggestion and should be reviewed manually.

3.60.1 Example

3.60.2 Wrong

```
<html lang="en"><head><title>Some page about something</title></head><body>....
```

3.60.3 Right

```
<html lang="en"><head><title>All about salamanders</title></head><body>....
```

3.61 The document title should not be placeholder text

Severity code: Severe error

The document title should not be wasted placeholder text which does not describe the page.

3.61.1 Example

3.61.2 Wrong

```
<html lang="en"><head><title>title</title></head><body>....
```

3.61.3 Right

```
<html lang="en"><head><title>All about salamanders</title></head><body>....
```

3.62 The document title should be short

Severity code: Possible error

The document title should be short and succinct. This test fails at 150 characters, but authors should consider this to be a suggestion.

3.62.1 Example

3.62.2 Wrong

```
<html lang="en"><head><title>A really long title about a page about salamanders that take a long time</title></head><body>....</body></html>
```

3.62.3 Right

```
<html lang="en"><head><title>All about salamanders</title></head><body>....</body></html>
```

3.63 The document should not have an empty title

Severity code: Severe error

The document should have a title element that is not white space

3.63.1 Example

3.63.2 Wrong

```
<html lang="en"><head><title> </title></head><body>....</body></html>
```

3.63.3 Right

```
<html lang="en"><head><title>My Great Web page</title></head><body>....</body></html>
```

3.64 Document must validate to the doctype

Severity code: Severe error

The document must validate to the declared doctype.

3.65 Visual lists of items are marked using ordered or unordered lists

Severity code: Severe error

Use the ordered (``) or unordered (``) elements for lists of items, instead of just using new lines which start with numbers or characters to create a visual list.

3.65.1 Example

3.65.2 Wrong

1. Item One
2. Item Two
3.Item Three

3.65.3 Right

```
<ol><li>Item One</li><li>2. Item Two</li><li>3.Item Three</ol>
```

3.66 Any words or phrases which are not the document's primary language should be marked

Severity code: Information only

If a document has words or phrases which are not in the document's primary language, those words or phrases should be properly marked. This helps indicate which language or voice a screen-reader should use to read the text.

3.66.1 Example

3.66.2 Wrong

```
<p>This is a paragraph in english.</p><p>Esta frase es en espa&ntilde;ol.</p> (Spanish) </p>
```

3.66.3 Right

```
<p>This is a paragraph in english.</p><p lang="es">Esta frase es en espa&ntilde;ol.</p>
```

3.67 All "embed" elements have an associated "noembed" element

Severity code: Severe error

Because some users cannot use the <code>embed element, provide alternative content in a <code>noembed element.

3.67.1 Example

3.67.2 Wrong

```
<embed src="html.mov"/>
```

3.67.3 Right

```
<embed src="html.mov"/><noembed>A move with <a href="transcript.html">an available transcript</a>.</noembed>
```

3.68 Embed” elements must have an “alt” attribute

Severity code: Severe error

All `<embed>` elements must have an “alt” attribute.

3.68.1 Example

3.68.2 Wrong

```
<embed src="dog.mov"/>
```

3.68.3 Right

```
<embed src="dog.mov" alt="A movie featuring a dog dancing a ballet."/>
```

3.69 Embed” elements cannot have an empty “alt” attribute

Severity code: Severe error

All `<embed>` elements must have an “alt” attribute that is not empty.

3.69.1 Example

3.69.2 Wrong

```
<embed src="dog.mov" alt=""/>
```

3.69.3 Right

```
<embed src="dog.mov" alt="A movie featuring a dog dancing a ballet."/>
```

3.70 All embed elements should provide a way for keyboard users to escape

Severity code: Information only

Ensure that a user who has only a keyboard as an input device can escape an `<embed>` element. This requires manual confirmation.

3.71 Emoticons should not be used excessively

Severity code: Possible error

Emoticons should not be used excessively to communicate feelings or content. Try to rewrite the document to have more textual meaning, or wrapping the emoticons in an `<abbr>` element as outlined below. Emoticons are not read by screen-readers, and are often used to communicate feelings or other things which are relevant to the content of the document.

3.71.1 Example

3.71.2 Wrong

Of course, I'll get on it right away ;)

3.71.3 Right

Of course, I'll get on it right away `<abbr title="wink">;)</abbr>`

3.72 All “file” input elements have a corresponding label

Severity code: 0

All `<input>` elements of type “file” should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.73 All “file” input elements have a label that is close

Severity code: Possible error

All input elements of type “file” must have a corresponding label that is close to the form element. Users of screen magnification or with reduced spatial skills are hampered in using a form element if the label for that element is located far away.

3.74 Font” elements should not be used

Severity code: Severe error

The `<basefont>` tag is deprecated and should not be used. Investigate using stylesheets instead.

3.75 Deleting items using a form should be reversable

Severity code: Information only

Check that, if a form has the option to delete an item, that the user has a chance to either reverse the delete process, or is asked for confirmation before the item is deleted. This is not something that can be checked through automated testing and requires manual confirmation.

3.76 Forms offer the user a way to check the results of their form before performing an irrevokable action

Severity code: Information only

If the form allows users to perform some irrevokable action, like ordering a product, ensure that users have the ability to review the contents of the form they submitted first. This is not something that can be checked through automated testing and requires manual confirmation.

3.77 Form error messages should assist in solving errors

Severity code: 0

If the form has some required fields or other ways in which the user can commit an error, check that the reply is accessible. Use the words “required” or “error” within the `<label>` element of input items where the errors happened

3.78 Input items which are required are marked as so in the label element

Severity code: Information only

If a form element is required, it should be marked as so. This should not be a mere red asterisk, but instead either a ‘required’ image with alt text of “required” or the actual text “required.” The indicator that an item is required should be included in the input element’s `<label>` element.

3.78.1 `<h4>`Examples`</h4>`Wrong

```
<label for="first_name">First Name</label>*<input type="text" id="first_name" name="first_name"/>
```

```
<label for="first_name">First Name (required)</label> <input type="text" id="first_name" name="first_name"/>
```

3.79 Frames are not used

Severity code: Severe error

Frame elements should not be used.

3.80 Complex framesets should contain a “longdesc” attribute

Severity code: 50

If a `<frameset>` contains three or more frames, use a “longdesc” attribute to help describe the purpose of the frames.

3.80.1 Example

3.80.2 Wrong

```
<frameset cols="25%
```

3.81 The source for each frame is accessible content.

Severity code: Information only

Each frame should contain accessible content, and contain content accessible to screen readers, like HTML as opposed to an image.

3.82 All “frame” elements should have a “title” attribute that describes the purpose of the frame

Severity code: Information only

Each `<frame>` elements should have a “title” attribute which describes the purpose or function of the frame.

3.82.1 Example

3.82.2 Wrong

```
<frame src="navigation.html"></frame>
```

3.82.3 Right

```
<frame src="navigation.html" title="The site navigation"></frame>
```

3.83 Frames cannot have empty “title” attributes

Severity code: Severe error

All `<frame>` elements must have a valid “title” attribute.

3.84 Frames cannot have “title” attributes that are just placeholder text

Severity code: 0

Frame “title” attributes should not be simple placeholder text like “frame

3.85 All “frame” elements should have a “title” attribute

Severity code: Severe error

Each `<frame>` elements should have a “title” attribute.

3.85.1 Example

3.85.2 Wrong

```
<frame src="navigation.html"></frame>
```

3.85.3 Right

```
<frame src="navigation.html" title="The site navigation"></frame>
```

3.86 The “frameset” element should not be used

Severity code: Severe error

Frameset elements should not be used.

3.87 All framesets should contain a noframes section

Severity code: 50

If a `<frameset>` contains three or more frames, use a “longdesc” attribute to help describe the purpose of the frames.

3.87.1 Example

3.87.2 Wrong

```
<frameset cols="25%
```

3.88 The header following an h1 is h1 or h2

Severity code: Information only

The header following an `<h1>` element should either be an `<h2>` or another `<h1>`.

Users of screen readers often use headers to make sense of the structure of the document, and having headers in the right order can be very helpful. It also helps the document itself to be consistently structured.

3.89 All h1 elements are not used for formatting

Severity code: Information only

An `<h1>` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.89.1 Example

3.89.2 Wrong

```
<h1>I wanted a line to be bold and large but this is just a regular paragraph.</h1>
```

3.89.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</strong></p>
```

3.90 The header following an h2 is h1, h2 or h3

Severity code: Information only

The header following an `<h2>` element should either be an `<h3>`, `<h1>` or another `<h2>`.

Users of screen readers often use headers to make sense of the structure of the document, and having headers in the right order can be very helpful. It also helps the document itself to be consistently structured.

3.91 All h2 elements are not used for formatting

Severity code: Information only

An `<h2>` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.91.1 Example

3.91.2 Wrong

```
<h2>I wanted a line to be bold and large but this is just a regular paragraph.</h2>
```

3.91.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</strong></p>
```

3.92 The header following an h3 is h1, h2, h3 or h4

Severity code: Information only

The header following an `<h3>` element should either be an `<h4>`, `<h2>`, `<h1>` or another `<h3>`.

Users of screen readers often use headers to make sense of the structure of the document, and having headers in the right order can be very helpful. It also helps the document itself to be consistently structured.

3.93 All h3 elements are not used for formatting

Severity code: Information only

An `<h3>` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.93.1 Example

3.93.2 Wrong

```
<h3>I wanted a line to be bold and large but this is just a regular paragraph.</h3>
```

3.93.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</strong></p>
```

3.94 The header following an h4 is h1, h2, h3, h4 or h5

Severity code: Information only

The header following an `<h4>` element should either be an `<h5>`, `<h3>`, `<h2>`, `<h1>`, or another `<h4>`.

Users of screen readers often use headers to make sense of the structure of the document, and having headers in the right order can be very helpful. It also helps the document itself to be consistently structured.

3.95 All h4 elements are not used for formatting

Severity code: Information only

An `<h4>` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.95.1 Example

3.95.2 Wrong

```
<h4>I wanted a line to be bold and large but this is just a regular paragraph.</h4>
```

3.95.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</p>
```

3.96 The header following an h5 is h6 or any header less than h6

Severity code: Information only

The header following an `<h5>` element should either be an `<h6>`, `<h3>`, `<h2>`, `<h1>`, or another `<h5>`.

Users of screen readers often use headers to make sense of the structure of the document, and having headers in the right order can be very helpful. It also helps the document itself to be consistently structured.

3.97 All h5 elements are not used for formatting

Severity code: Information only

An `<h5>` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.97.1 Example

3.97.2 Wrong

```
<h5>I wanted a line to be bold and large but this is just a regular paragraph.</h5>
```

3.97.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</strong></p>
```

3.98 All h6 elements are not used for formatting

Severity code: Information only

An `h6` element may not be used purely for formatting.

Users of screen readers often use headers to discover the structure of the document, and using headers for formatting can cause this method of navigating the document to be confusing. Try using CSS styles to apply formatting to the item instead.

3.98.1 Example

3.98.2 Wrong

```
<h6>I wanted a line to be bold and large but this is just a regular paragraph.</h6>
```

3.98.3 Right

```
<p class="large-item"><strong>I wanted a line to be bold and large but this is just a regular paragraph.</strong></p>
```

3.99 All headers should contain readable text

Severity code: Severe error

Users with screen readers use headings like the tabs `h1` to navigate the structure of a page. All headings should contain either text, or images with appropriate `alt` attributes.

3.100 Use headers to mark the beginning of each section

Severity code: Possible error

Check that each logical section of the page is broken or introduced with a header (`<h1-h6>`) element.

3.101 The “i” (italic) element is not used

Severity code: Severe error

The `i` (italic) element provides no emphasis for non-sighted readers. Use the `em` tag instead.

3.101.1 Example

3.101.2 Wrong

```
<p>I think that you <i>should really read this</i>.</p>
```

3.101.3 Right

```
<p>I think that you <em>should really read this</em>.</p>
```

3.102 Inline frames (“iframes”) should not have a “longdesc” attribute

Severity code: Severe error

Iframe elements should not have a "longdesc" attribute.

3.103 All links in a server-side map should have duplicate links available in the document

Severity code: Severe error

Any image with an “usemap” attribute for a server-side image map should have the available links duplicated elsewhere.

3.104 If an image is purely decorative, the “alt” text must be empty

Severity code: 0

Any image that is only decorative (serves no function or adds to the purpose of the page content) should have an “alt” attribute

3.105 Any image within a link must have “alt” text the describes the link destination

Severity code: Information only

Any image that is within a link should have an “alt” attribute which identifies the destination or purpose of the link.

3.105.1 Example

3.105.2 Wrong

```
<a href="home.html"></a>
```

3.105.3 Right

```
<a href="home.html"></a>
```

3.106 Image “alt” attributes should not be the same as the filename

Severity code: 0

All `` elements should have an “alt” attribute that is not just the name of the file

3.107 Check that any text within an image is also in the “alt” attribute

Severity code: 0

If an image has text within it, that text should be repeated in the “alt” attribute

3.108 Image Alt text is short

Severity code: 0

All “alt” attributes for `` elements should be clear and concise. “Alt” attributes over 100 characters long should be reviewed to see if they are too long.

3.108.1 Example

3.108.2 Wrong

```
` element) that has no other text cannot have an empty or missing “alt” attribute.

### 3.109.1 Example

### 3.109.2 Wrong

```

```

### 3.109.3 Right

```

```

## 3.110 Images should not have a simple placeholder text as an “alt” attribute

*Severity code:* Severe error

Any image that is not used decoratively or which is purely for layout purposes cannot have an “alt” attribute that consists solely of placeholders. Placeholders include:

### 3.110.1 `<ul><li>nbsp</li><li>&nbsp;</li><li>spacer</li><li>image</li><li>img</li><li>photo`

### 3.110.2 Wrong

```

```

### 3.110.3 Right

```

```

## 3.111 Unless the image files are the same, no image should contain redundant alt text

*Severity code:* Severe error

Every distinct image on a page should have its own `<em>alt</em>` text which is different than all the others on the page to avoid redundancy and confusion.

### 3.111.1 Example

### 3.111.2 Wrong

```
` elements must have an alt attribute

3.113.1 Example

3.113.2 Wrong

```

```

3.113.3 Right

```

```

3.114 A “longdesc” attribute is required for any image where additional information not in the “alt” attribute is required

Severity code: Severe error

Any image that has an “alt” attribute that does not fully convey the meaning of the image must have a “longdesc” attribute.

3.114.1 Example

3.114.2 Wrong

```

```

3.114.3 Right

```

```

3.115 Images that are important should not have a purely white-space “alt” attribute

Severity code: 0

Any image that is not used decoratively or which is purely for layout purposes cannot have an “alt” attribute that consists solely of white space (i.e. a space)

3.116 All links within a client-side image are duplicated elsewhere in the document

Severity code: 0

Any image that has a “usemap” attribute must have links replicated somewhere else in the document.

3.116.1 Example

3.116.2 Wrong

```
<p><map name="imagemap" id="map1"><area shape="poly" coords="185
```

3.117 An image with a “longdesc” attribute should have a corresponding description link

Severity code: 0

Any image that has a “longdesc” attribute must also have a corresponding “d-link

3.118 Any non-decorative images should have a non-empty “alt” attribute

Severity code: Possible error

Any image that is not used decoratively or which is purely for layout purposes cannot have an empty “alt” attribute.

3.118.1 Example

3.118.2 Wrong

```

```

3.118.3 Right

```

```

3.119 For any image, the “alt” text cannot refer to color alone

Severity code: 0

The “alt” text or content text for any image should not refer to the image by color alone. This is often fixed by changing the “alt” text to the meaning of the image

3.120 Server-side image maps should not be used

Severity code: Severe error

Server-side image maps should not be used.

3.121 Images should not have a “title” attribute

Severity code: Severe error

Images should not contain a “title” attribute.

3.121.1 Example

3.121.2 Wrong

```

```

3.121.3 Right

```

```

3.122 Any image with an “ismap” attribute have a valid “usemap” attribute

Severity code: 0

If an image has an “ismap” attribute

3.123 Images which contain math equations should provide equivalent MathML

Severity code: Information only

Images which contain math equations should be accompanied or link to a document with the equivalent equation marked up with `MathML`.

3.123.1 Example

3.123.2 Wrong

```

```

3.123.3 Right

```
 <a href="http://www.w3.org/Math/">MathML</a>
```

3.124 All “checkbox” input elements require a valid “tabindex” attribute

Severity code: Severe error

All `<input>` elements of type “checkbox” should have a “tabindex” attribute to help navigate the form with a keyboard alone.

3.125 Logical groups of check boxes should be grouped with a “fieldset”

Severity code: Severe error

Related “checkbox” input fields should be grouped together using a `<fieldset>`

3.125.1 Example

3.125.2 Wrong

```
<input type="checkbox" name="option-a" id="a" /><label for="a">Option A</label><br/><input type="checkbox" name="option-b" id="b" /><label for="b">Option B</label>
```

3.125.3 Right

```
<fieldset><legend>Several options</legend><input type="checkbox" name="option-a" id="a" /><label for="a">Option A</label><br/><input type="checkbox" name="option-b" id="b" /><label for="b">Option B</label></fieldset>
```

3.126 An “input” element should not use color alone

Severity code: Information only

All input elements should not refer to content by color alone.

3.127 Input elements which are not images should not have an “alt” attribute

Severity code: 0

Because of inconsistencies in how user agents use the “alt” attribute

3.128 All “file” input elements require a valid “tabindex” attribute

Severity code: Severe error

All `<input>` elements of type “file” should have a “tabindex” attribute to help navigate the form with a keyboard alone.

3.129 All “input” elements with a type of “image” must have an “alt” attribute that describes the function of the input

Severity code: 0

All `<input>` elements with a type of “image” should have an “alt” attribute

3.130 All “input” elements with a type of “image” must have an “alt” attribute which is not the same as the filename

Severity code: 0

All `<input>` elements with a type of “image” should have an “alt” attribute

3.131 All “input” elements with a type of “image” must have an “alt” attribute which is not placeholder text

Severity code: 0

All `<input>` elements with a type of “image” should have an “alt” attribute

3.132 All “input” elements with a type of “image” must have an “alt” attribute which is as short as possible

Severity code: 0

All `<input>` elements with a type of “image” should have an “alt” attribute

3.133 The “alt” text for input “image” submit buttons must not be filler text

Severity code: Severe error

Every form image button should not simply use filler text like “button” or “submit” as the “alt” text.

3.133.1 Example

3.133.2 Wrong

```
<input type="image" src="mangifier.png" alt="submit"/>
```

3.133.3 Right

```
<input type="image" src="mangifier.png" alt="Search this site"/>
```

3.134 All “input” elements with a type of “image” must have an “alt” attribute

Severity code: Severe error

All `<input>` elements with a type of “image” should have an “alt” attribute.

3.134.1 Example

3.134.2 Wrong

```
<input type="image" name="search" src="search.png"/>
```

3.134.3 Right

```
<input type="image" name="search" src="search.png" alt="Search"/>
```

3.135 The “alt” text for input “image” buttons must be the same as text inside the image

Severity code: 0

Every form image button which has text within the image (say, a picture of the word “Search” in a special font)

3.136 All “password” input elements require a valid “tabindex” attribute

Severity code: Severe error

All `<input>` elements of type “password” should have a “tabindex” attribute to help navigate the form with a keyboard alone.

3.137 All “radio” input elements require a valid “tabindex” attribute

Severity code: Severe error

All `<input>` elements of type “radio” should have a “tabindex” attribute to help navigate the form with a keyboard alone.

3.138 All input elements, type of “submit

Severity code: 0

have a valid tab index.

3.139 All “input” elements should have a corresponding “label

Severity code: 0

All `<input>` elements should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.140 All “text” input elements require a valid “tabindex” attribute

Severity code: Severe error

All `<input>` elements of type “text” should have a “tabindex” attribute to help navigate the form with a keyboard alone.

3.141 All “input” elements of type “text” must have a default text

Severity code: Severe error

All `<input>` elements with a type of “text” should have a default text.

3.141.1 Example

3.141.2 Wrong

```
<label for="search">Search: </label><input type="text" name="search" id="search"/>
```

3.141.3 Right

```
<label for="search">Search: </label><input type="text" name="search" id="search" value="Search"/>
```

3.142 Text” input elements require a non-whitespace default text

Severity code: Severe error

All `<input>` elements with a type of “text” should have a default text which is not empty.

3.142.1 Example

3.142.2 Wrong

```
<label for="search">Search: </label><input type="text" name="search" id="search" value=""/>
```

3.142.3 Right

```
<label for="search">Search: </label><input type="text" name="search" id="search" value="Search"/>
```

3.143 Label” elements should not contain an input element

Severity code: Severe error

Label elements should not contain an `<input>` element as well.

3.143.1 Example

3.143.2 Wrong

```
<label for="first_name">First name: <input type="text" id="first_name" name="first_name"/></label>
```

3.143.3 Right

```
<label for="first_name">First name: </label><input type="text" id="first_name" name="first_name"/>
```

3.144 Every form input must have only one label

Severity code: Severe error

Each form input should have only one `<label>` element.

3.144.1 Example

3.144.2 Wrong

```
<label for="first_name"> First name:</label> <label for="first_name">(Required)</label> <input type="text" id="first_name" name="first_name"/>
```

3.144.3 Right

```
<label for="first_name"> First name: (Required)</label> <input type="text" id="first_name" name="first_name"/>
```

3.145 Labels must contain text

Severity code: Severe error

Label elements should contain text which communicates the purpose of its assigned input element.

3.145.1 Example

3.145.2 Wrong

```
<label for="first_name"> </label>First name: <input type="text" id="first_name" name="first_name"/>
```

3.145.3 Right

```
<label for="first_name">First name: </label><input type="text" id="first_name" name="first_name"/>
```

3.146 All labels should be associated with an input

Severity code: Severe error

All `<label>` elements should be assigned to an input item, and should have a `for` attribute which equals the `id` attribute of a form element.

3.147 All “legend” elements must describe the group of choices

Severity code: Information only

If a `<code>legend` element is used in a fieldset, the `<code>legend` content must describe the group of choices.

3.147.1 Example

3.147.2 Wrong

```
<fieldset>    <legend>Some fields:</legend>    <label for="name">Name:</label> <input type="text" size="30" id="name">
```

3.147.3 Right

```
<fieldset>    <legend>Personal Information:</legend>    <label for="name">Name:</label> <input type="text" size="30" id="name">
```

3.148 Legend” text must not contain just whitespace

Severity code: Severe error

If a `<code>legend` element is used in a fieldset, the `<code>legend` should not contain empty text.

3.148.1 Example

3.148.2 Wrong

```
<fieldset>    <legend> </legend>    <label for="name">Name:</label> <input type="text" size="30" id="name">
```

3.148.3 Right

```
<fieldset>    <legend>Personal Information:</legend>    <label for="name">Name:</label> <input type="text" size="30" id="name">
```

3.149 Legend” text must not contain placeholder text like “form” or “field

Severity code: Severe error

If a `<code>legend` element is used in a fieldset, the `<code>legend` should not contain useless placeholder text.

3.149.1 Example

3.149.2 Wrong

```
<fieldset> <legend>Form</legend> <label for="name">Name:</label> <input type="text" size="30"
```

3.149.3 Right

```
<fieldset> <legend>Personal Information:</legend> <label for="name">Name:</label> <input type="text" size="30"
```

3.150 Use a “link” element for alternate content

Severity code: Information only

Documents which contain things like videos, sound, or other forms of media that are not accessible, should provide a `<link>` element with a “rel” attribute of “alternate” in the document header.

3.150.1 Example

```
<head><link rel="alternate" href="transcription.html"/></head>
```

3.151 Document uses link element to describe navigation if it is within a collection.

Severity code: Severe error

The link element can provide metadata about the position of an HTML page within a set of Web units or can assist in locating content with a set of Web units.

3.152 Lists should not be used for formatting

Severity code: Information only

Lists like `` and `` are to provide a structured list, and should not be used to format text. This test views any list with just one item as suspicious, but should be manually reviewed.

3.152.1 Example

3.152.2 Wrong

```
<ul><li>Something I just wanted indented</li></ul>
```

3.152.3 Right

```
<p style="margin-left: 10px;">Something I just wanted indented</p>
```

3.153 The “marquee” tag should not be used

Severity code: Severe error

The `marquee` element is difficult for users to read and is not a standard HTML element. Try to find another way to convey the importance of this text.

3.153.1 Example

3.153.2 Wrong

```
<marquee>This is really hard to read</marquee>
```

3.153.3 Right

```
<strong>This is much easier to read</strong>
```

3.154 Menu” elements should not be used for formattin

Severity code: Information only

Menu is a deprecated tag, but is still honored in a transitional DTD. Menu tags are to provide structure for a document and should not be used for formatting. If a menu tag is to be used, it should only contain an ordered or unordered list of links.

3.154.1 Example

3.154.2 Wrong

```
<menu>Something I wanted Indented</menu>
```

3.154.3 Right

```
<p style="margin-left: 20px;">Something I wanted indented.</p>
```

3.155 Noembed” elements must be the same content as their “embed” element

Severity code: Information only

All `noembed` elements must contain or link to an accessible version of their `embed` counterparts.

3.155.1 Example

3.155.2 Wrong

```
<embed src="podcast.mp3"/><noembed>Some podcast</noembed>
```

3.155.3 Right

```
<embed src="podcast.mp3"/><noembed>A podcast about dogs. <a href="transcript.html">Read the full tran
```

3.156 All “noframes” elements should contain the text content from all frames

Severity code: Possible error

The `<noframes>` content should either replicate or link to the content visible within the frames.

3.157 When objects are disabled, content should still be available

Severity code: Information only

The content within objects should still be available, even if the object is disabled. To do this, place a link to the direct object source within the `<object>` tag.

3.157.1 Example

3.157.2 Wrong

```
<object src="something.html"></object>
```

3.157.3 Right

```
<object src="something.html"><a href="something.html">Read something</a></object>
```

3.158 Objects do not flicker

Severity code: Information only

The content within an `<object>` tag must not flicker.

3.159 Objects must not use color to communicate alone

Severity code: Information only

Objects should contain content that makes sense without color and is accessible to users who are color blind.

Objects cannot be checked using automated tools, this should be reviewed manually.

3.160 Interfaces within objects must be accessible

Severity code: Information only

Object content should be assessed for accessibility.

Objects cannot be checked using automated tools, this should be reviewed manually.

3.161 Objects which reference multimedia files should also provide a link to a transcript

Severity code: Information only

If an object contains a video, a link to the transcript should be provided near the object.

3.161.1 Example

3.161.2 Wrong

```
<object src="video.mov"></object>
```

3.161.3 Right

```
<object src="video.mov"></object><a href="transcript.html">Read Transcript of the video</a>
```

3.162 Objects must contain their text equivalents

Severity code: Severe error

All `object` elements should contain a text equivalent if the object cannot be rendered.

3.162.1 Example

3.162.2 Wrong

```
<object src="widget.html" title=""></object>
```

3.162.3 Right

```
<object src="widget.html" title="A small web widget">A widget of stock prices. <a href="widget.html">
```

3.163 Every object should contain an “embed” element

Severity code: Severe error

Every `<object>` element must also contain an `<embed>` element.

3.163.1 Example

3.163.2 Wrong

```
<object data="movie.mov"></object>
```

3.163.3 Right

```
<object data="movie.mov"><embed src="movie.mov"></embed></object>
```

3.164 Objects should have a title attribute

Severity code: Severe error

All `<object>` elements should contain a “title” attribute.

3.164.1 Example

3.164.2 Wrong

```
<object src="widget.html"></object>
```

3.164.3 Right

```
<object src="widget.html" title="A small web widget"></object>
```

3.165 Objects must not have an empty title attribute

Severity code: Severe error

All `<object>` elements should have a “title” attribute which is not empty.

3.165.1 Example

3.165.2 Wrong

```
<object src="widget.html" title=""></object>
```

3.165.3 Right

```
<object src="widget.html" title="A small web widget"></object>
```

3.166 All objects should provide a way for keyboard users to escape

Severity code: Information only

Ensure that a user who has only a keyboard as an input device can escape a `<code>object` element. This requires manual confirmation.

3.167 An object might require a long description

Severity code: Information only

Objects might require a long description, especially if their content is complicated.

3.167.1 Example

3.167.2 Wrong

```
<object data="map_of_the_world.mov"></object>
```

3.167.3 Right

```
<object data="map_of_the_world.mov" longdesc="description.html"></object>
```

3.168 The text equivalents of an object should update if the object changes

Severity code: Information only

If an object changes, the text equivalent of that object should also change.

Objects cannot be checked using automated tools, this should be reviewed manually.

3.169 Content within an “object” element should be usable with objects disabled

Severity code: Information only

Objects whose content changes using java, ActiveX, or other similar technologies, should have their default text change when the object’s content changes.

3.170 Objects with “classid” attributes should change their text if the content of the object changes

Severity code: Severe error

Objects whose content changes using java, ActiveX, or other similar technologies, should have their default text change when the object’s content changes.

3.171 Paragraphs must not be used for headers

Severity code: Severe error

Headers like `<h1-h6>` are extremely useful for non-sighted users to navigate the structure of the page, and formatting a paragraph to just be big or bold, while it might visually look like a header, does not make it one.

3.171.1 Example

3.171.2 Wrong

```
<p><strong>Something that really should be a header</strong></p>
```

3.171.3 Right

```
<h3>Something that really should be a header</h3>
```

3.172 All password input elements should have a corresponding label

Severity code: 0

All `<input>` elements with a type of “password” should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.173 All “password” input elements have a label that is close

Severity code: Possible error

All input elements of type “password” must have a corresponding label that is close to the form element. Users of screen magnification or with reduced spatial skills are hampered in using a form element if the label for that element is located far away.

3.174 Pre” elements should not be used for tabular data

Severity code: Information only

If a `<pre>` element is used for tabular data, change the data to use a well-formed table.

3.175 All “radio” input elements have a corresponding label

Severity code: 0

All `<input>` elements of type “radio” should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.176 All “radio” input elements have a label that is close

Severity code: Possible error

All input elements of type “radio” must have a corresponding label that is close to the form element. Users of screen magnification or with reduced spatial skills are hampered in using a form element if the label for that element is located far away.

3.177 All radio button groups are marked using fieldset and legend elements.

Severity code: Severe error

form element content must contain both fieldset and legend elements if there are related radio buttons.

3.178 Content on the page should still be available if scripts are disabled

Severity code: Information only

All scripts should be assessed to see if, when the user is browsing with scrips turned off, the page content is still available.

3.179 Scripts should have a corresponding “noscript” element

Severity code: 0

Scripts should be followed by a `<noscripts>` element to guide the user to content in an alternative way.

3.179.1 Example

3.179.2 Wrong

```
<script type="text/javascript">document.write("Hello World!")</script>
```

3.179.3 Right

```
<script type="text/javascript">document.write("Hello World!")</script><noscript>Hello
```

3.180 If an element has an “onclick” attribute

Severity code: 0

it should also have an “onkeypress” attribute

3.181 Any element with an “ondblclick” attribute shoul have a keyboard-related action as well

Severity code: 0

If an element has an “ondblclick” attribute

3.182 If an element has a “mousedown” attribute

Severity code: 0

it should also have an “onkeydown” attribute

3.183 Any element with an “onmousemove” attribute shoul have a keyboard-related action as well

Severity code: 0

If an element has an “onmousemove” attribute

3.184 If an element has a “onmouseout” attribute

Severity code: 0

it should also have an “onblur” attribute

3.185 If an element has an “onmouseover” attribute

Severity code: 0

it should also have an “onfocus” attribute

3.186 If an element has an “onmouseup” attribute

Severity code: 0

it should also have an “onkeyup” attribute

3.187 The user interface for scripts should be accessible

Severity code: Information only

All scripts should be assessed to see if their interface is accessible.

3.188 Scripts should not cause the screen to flicker

Severity code: Information only

All scripts should be assessed to see if their interface does not flicker.

3.189 The interface in scripts should not use color alone

Severity code: Information only

All scripts should be assessed to see if their interface does not have an interface which requires distinguishing between colors alone.

3.190 Select” elemetns must not contain an “onchange” attribute

Severity code: Severe error

Actions like “onchange” can take control away from users who are trying to navigate the page. Using an “onchange” attribute for things like select-list menus should instead be replaced with a drop-down and a button which initiates the action.

3.190.1 Example

3.190.2 Wrong

```
<form><select onchange="location = this.options[this.selectedIndex].value;"><option value="home.html">
```

3.190.3 Right

```
<form action="go.html"><select><option value="home.html">Home Page</option><option value="dog.html">
```

3.191 All select elements have an explicitly associated label.

Severity code: 0

All `<select>` elements should have a corresponding `<label>` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.192 Select jump menus should jump on button press, not on state change

Severity code: Possible error

If you wish to use a ‘Jump’ menu with a select item that then redirects users to another page, the jump should occur on the user pressing a button, rather than on the change event of that select element.

3.193 Form select elements should use optgroups for long selections

Severity code: Possible error

Select form elements with long lists of items should use the `<optgroup>` tag to group like selections.

3.194 Websites must have a site map

Severity code: Information only

Every web site should have a page which provides a site map or another method to navigate most of the site from a single page to save time for users of assistive devices.

3.195 A “skip to content” link should exist as one of the first links on the page

Severity code: 0

A link reading “skip to content

3.196 Inline SVG should use Title elements

Severity code: Severe error

Any inline SVG image should have an embedded `<title>` element

3.197 The tab order of a document is logical

Severity code: Possible error

Check that the tab-order of a page is logical.

3.198 Captions should identify their table

Severity code: Information only

Check to make sure that a table's caption identifies the table with a name, figure number, etc.

3.199 Complex tables should have a summary

Severity code: 0

If a table is complex (for example, has some cells with "colspan" attributes

3.200 Data tables should contain "th" elements

Severity code: Severe error

Tables which contain data (as opposed to layout tables) should contain `<th>` elements to mark headers for screen readers and enhance the structure of the document.

3.200.1 Example

3.200.2 Wrong

```
<table><tr><td>Header One</td><td>Header Two</td></tr><tr><td>1.30</td><td>4.50</td></tr></table>
```

3.200.3 Right

```
<table><tr><th>Header One</th><th>Header Two</th></tr><tr><td>1.30</td><td>4.50</td></tr></table>
```

3.201 Table header labels must be terse

Severity code: Possible error

The "abbr" attribute for table headers must be terse (less than 20 characters long).

3.202 Mark up the areas of tables using “thead

Severity code: 0

tbody

3.203 Layout tables should not contain “th” elements

Severity code: Information only

Tables which are used purely for layout (as opposed to data tables), **should not** contain `<th>` elements, which would make the table appear to be a data table.

3.203.1 Example

3.203.2 Wrong

```
<table><tr><th>Sidebar</th><th>Content</th><tr><td>Navigation</td><td>Stuff</td></tr></table>
```

3.203.3 Right

```
<table><tr><td>Sidebar</td><td>Content</td><tr><td>Navigation</td><td>Stuff</td></tr></table>
```

3.204 All tables used for layout have no “caption” element

Severity code: Severe error

If a table contains no data, and is used simply for layout, then it should not contain a `<caption>` element.

3.204.1 Example

3.204.2 Wrong

```
<table><caption>The layout of this page, broken into two areas.</caption>...
```

3.204.3 Right

```
<table>...
```

3.205 All tables used for layout have no summary or an empty summary

Severity code: 0

If a table contains no data, and is used simply for layout, then it should not have a “summary” attribute

3.206 All tables used for layout should make sense when removed

Severity code: Information only

If a `<table>` element is used for layout purposes only, then the content of the table should make sense if the table is linearized.

3.207 Table summaries should describe the navigation and structure of the table

Severity code: Information only

Table `<summary>` elements should describe the navigation tools and structure of the table, as well as provide an overview of what the table describes.

3.208 Table “summary” elements should not duplicate the “caption” element

Severity code: Severe error

The summary and the caption must be different, as both provide different information. A `<caption>` element identifies the table., while the “summary” attribute describes the table contents.

3.209 All data tables should have a summary

Severity code: Possible error

If a table contains data, it should have a “summary” attribute.

3.209.1 Example

3.209.2 Wrong

```
<table>
```

3.209.3 Right

```
<table summary="A table of data">
```

3.210 All data tables should have an adequate summary

Severity code: Information only

If a table contains data, it should have a “summary” attribute that completely communicates the function and use of the table.

3.210.1 Example

3.210.2 Wrong

```
<table summary="A table of stuff">
```

3.210.3 Right

```
<table summary="A comparison of population rates amongst North American cities.">
```

3.211 Group columns using “colgroup” or “col” elements

Severity code: Information only

To help complex table headers make sense, use `<colgroup>` or `<col>` to group them together.

3.212 Table headers over 20 characters should provide an “abbr” attribute

Severity code: Information only

For long table headers, use an “abbr” attribute that is less than short (less than 20 characters long).

3.212.1 `<h4>`Examples`</h4>`Wrong

```
<th>The total number of people who liked chocolate</th>
```

3.212.2 Right

```
<th abbr="Like Chocolate">The total number of people who liked chocolate</th>
```

3.213 Data tables should contain a “caption” element if not described elsewhere

Severity code: Severe error

Unless otherwise described in the document, tables should contain `<caption>` elements to describe the purpose of the table.

3.213.1 Example

```
<table><caption>A short description of this table</caption></table>
```

3.214 Data tables should use scoped headers for rows with headers

Severity code: Possible error

Where there are table headers for both rows and columns, use the “scope” attribute to help relate those headers with their appropriate cells. This test looks for the first and last cells in each row and sees if they differ in layout or font weight.

3.214.1 Example

3.214.2 Wrong

```
<table>
  <thead>
    <tr>
      <th>Should be scoped</th>
      <th>Item two</th>
      <th>Item three</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td><strong>Row one</strong></td>
      <td>1</td>
      <td>2</td>
    </tr>
    <tr>
      <td><strong>Row two</strong></td>
      <td>1</td>
      <td>2</td>
    </tr>
  </tbody>
</table>
```

3.214.3 Right

```
<table>
  <thead>
    <tr>
      <th>Should be scoped</th>
      <th>Item two</th>
      <th>Item three</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <th scope="row"><strong>Row one</strong></th>
      <td>1</td>
      <td>2</td>
    </tr>
    <tr>
      <th scope="row">Row two</th>
      <td>1</td>
      <td>2</td>
    </tr>
  </tbody>
</table>
```

```
</tr>
</tbody>
</table>
```

3.215 Data tables with multiple headers should use the “scope” attribute

Severity code: Possible error

Where there are table headers for both rows and columns, use the “scope” attribute to help relate those headers with their appropriate cells.

3.216 Complex data tables should provide “id” attributes to headers

Severity code: 0

and “headers” attributes for data cells

3.217 All tabular information should use a table

Severity code: Possible error

Tables should be used when displaying tabular information.

3.218 The text size is not less than 9 pixels high

Severity code: Possible error

To help users with difficulty reading small text, ensure text size is no less than 9 pixels high.

3.219 All textareas should have a corresponding label

Severity code: 0

All `textarea` elements should have a corresponding `label` element. Screen readers often enter a “form mode” where only label text is read aloud to the user

3.220 All textareas should have a label that is close to it

Severity code: Possible error

All `textarea` elements should have a corresponding `label` element that is close in proximity..

3.220.1 Example

3.220.2 Wrong

```
<label for="essay">Enter your essay:</label> [... lots of stuff ...] <textarea id="essay" name="essay">
```

3.220.3 Right

```
<label for="essay">Enter your essay:</label> <textarea id="essay" name="essay"></textarea>
```

3.221 All video tags must provide captions

Severity code: Possible error

All HTML5 video tags must provide captions.

3.222 All linked or embedded videos need captions

Severity code: Severe error

Any video hosted or otherwise which is linked or embedded must have a caption.
